

Our plans for the TaskMe app has not been altered much because we are confident we will be able to achieve our goals. We have Linked our TaskMe AndroidStudio project via GitHub and we plan to collaborate using git.

GITHUB REPO LINK: <https://github.com/eathanmccue/TaskMe>

In order to achieve our Goals for the TaskMe app, we must complete the following tasks:

Layout and Design

We must implement the layout for our activities. Therefore we must add:

- A calendar Widget
- Task activity text view
- Goal activity text view
- Motivational Quote text view.
- Necessary buttons such as the (+) new event button
- Edit text forms to enter location, time, recurrence etc

We plan on achieving this by using constraint layouts and horizontal/vertical guidelines and saving strings into string.xml . A recycler list may be used to view Goal/Task events. Additionally, it is important to have a Landscape mode that is clear & coherent

Java implementation

There are many tasks regarding using Java that we must accomplish for our app to function. Such as:

- Implementing the “CreateEvent” , “EditEvent” , “DeleteEvent” Activities/functions which would allow the user to add, edit, and delete events.
- Within the CreateEvent, we must implement the functionality to assign the event as a goal or task, event details such as the (date, time, “details text field” for additional info, recurrence (if the event happens every week), and alarms/reminders.
- We must implement the functionality to edit our events or destroy them.
- We must implement the functionality of having alerts or reminders. (notifications, alarms etc)
- We must implement the functionality to view motivational quotes
